ABOUT AMERICAN CARBON REGISTRY® (ACR)

A leading carbon offset program founded in 1996 as the first private voluntary GHG registry in the world, ACR operates in the voluntary and regulated carbon markets. ACR has unparalleled experience in the development of environmentally rigorous, science-based offset methodologies as well as operational experience in the oversight of offset project verification, registration, offset issuance and retirement reporting through its online registry system.

conducted to produce a product either in a manufacturing facility or at a construction location.

**Foam use**

After the foam is manufactured (e.g., blown with the BA) the material is then “used” (e.g. insulates a refrigerator, a building, etc.). The use of a foam can extend many years after manufacturing and this methodology captures the emissions associated with the use of the product for 10 years after manufacturing.

**Formulators**

Also known as "Systems Supply Houses". These entities provide the "A" side and the "B" side chemicals which are then blown at a manufacturing site to produce foam products or at a construction site for buildings.

**Global warming potential**

Global warming potential is a relative scale translating the global warming impact of any GHG into its CO$_2$e over the same timeframe. This methodology references the 100-year GWPs in the IPCC Fourth Assessment Report (AR4) and, if unavailable, the GWPs from the IPCC Fifth Assessment Report (AR5). If neither are available, GWPs cited by the U.S. EPA SNAP Program shall be applied. GWPs found in this Methodology (Tables 3 and 9) shall be applied in the quantification of baseline and project emissions.

**Hydrocarbon HC**

An organic compound containing only hydrogen and carbon atoms (e.g. pentane (C$_5$H$_{12}$) and propane (C$_3$H$_8$)).

**Hydrofluorocarbon HFC**

A gaseous compound that contains carbon, fluorine, and hydrogen. Most common HFCs used in foam

the smallest types, the refrigeration circuit is entirely brazed or welded (i.e., hermetically sealed). These systems are fully charged with refrigerant at the factory and typically require only an electric supply.

Refrigerated Food Processing and Dispensing Equipment primarily process the product by combining ingredients, and mixing/ preparing the ingredients at the proper temperature. Other equipment in this category function mainly as holding tanks to deliver the product at the desired temperature or to deliver chilled ingredients for processing, mixing and preparation. These may use a refrigerant in a heat pump or utilize waste heat from the condenser unit located elsewhere. Equipment within this end-use category include but are not limited to those used to process/store: chilled and frozen beverages (carbonated and uncarbonated, alcoholic and nonalcoholic); frozen custards, gelato, ice cream Italian ice, sorbets and yogurts; milkshakes, smoothies, and whipped cream.

### Significant New Alternatives Policy (SNAP)

SNAP program implements section 612 of the amended Clean Air Act of 1990, which requires EPA’s continuous review of alternatives to find those that pose less overall risk to human health and the environment. Through these evaluations, SNAP generates lists of acceptable and unacceptable substitutes for each of the major industrial use sectors. The intended effect of the SNAP program is to promote a smooth transition to safer alternatives.

### Sources, sinks, and reservoirs (SSRs)

Sources: Any process that releases carbon into the atmosphere is known as a carbon source.

1 BACKGROUND AND APPLICABILITY

1.1 PURPOSE

Certain industries use blowing agents (BAs) in the production of foam. These BAs contain chemicals that contribute to global warming by releasing greenhouse gases (GHGs) during manufacture, use, and end-of-life (EOL). Over the years, industry has begun a transition away from BAs that have high global warming potential (GWP) and high ozone depleting potential (ODP) toward BAs with lower GWP and low or zero ODP. However, certain foam applications have low market adoption rates for low GWP BA and that is generally a result of technical and financial barriers limiting use of low GWP options in these applications. This Methodology is meant to stimulate innovation and accelerate a transition to low GWP BAs in certain foam applications more rapidly than would otherwise occur. The Methodology is based on a robust data set from the United Nations Framework Convention on Climate Change (UNFCCC) Clean Development Mechanism (CDM) methodology AMS-III.N (Avoidance of HFC Emissions in Rigid Polyurethane Foam Manufacturing).

1.2 APPLICABILITY CONDITIONS

A transition to the use of an Eligible BA for the production of foam is considered a “Project Activity” under this Methodology.

In addition to satisfying the latest ACR program eligibility requirements as found in the ACR Standard, projects must satisfy the following conditions:

- The project is located in North America.
- The project is within an Eligible Foam Application (See Table 1).
- Other than for projects which use a Default BA, records of the Baseline BA used in the project must show a minimum of 2 years of usage of a BA with a GWP >30 prior to the Project Activity.
Table 1: Eligible Foam Applications

<table>
<thead>
<tr>
<th>FOAM APPLICATION</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>XPS boardstock</td>
<td>XPS boardstock, block, and billet that is used for insulation in the following applications: roofing, walls, flooring, and pipes. Does not include XPS sheet foam applications.</td>
</tr>
<tr>
<td>Two-component rigid PU spray foam</td>
<td>Spray foam is a two-part polyurethane application that when combined forms a solid foam insulation; involves a gun, nozzle or straw and forms foam as the ingredient chemicals are blended together.</td>
</tr>
</tbody>
</table>
| Rigid PU injected foam                  | A manufacturing process for producing component parts by injecting two or more liquid streams into a mold or part. Materials are fed into a mix-head, mixed, and forced into the mold cavity where they react, foam, cool and harden to the configuration of the cavity. Only Rigid PU injected foam used in the following sub-applications are eligible:  
  - Marine flotation or buoyancy  
  - Heating, Ventilation, Air Conditioning and Air Handling Systems  
  - Refrigerated Transport – Foam used in refrigerated logistics services such as refrigerated cargo boxes and coolers  
  - Small Retail Food Refrigeration – Includes Stand Alone Equipment and Refrigerated Food Processing and Dispensing Equipment  
  - Large Retail Food Refrigeration – Includes large, “engineered” systems used in supermarkets and walk-in freezers  
  - Industrial Refrigeration – Includes industrial process refrigeration and cold storage applications that employ cold storage panel insulation  
  - Garage and entry doors  |
| Rigid PUF residential refrigerators and freezers | Appliances used to preserve food and beverages in residential applications. |

1 See Appendix A and Tables 7 and 8 for market penetration analysis for Eligible Foam Applications.
1.3 REPORTING PERIODS

Projects shall have one reporting period which must not exceed 12 months in length. Baseline and project emissions shall be quantified (per Section 4) using the total volume of BA that would have been used in the absence of the Project Activity over a maximum of 12 months (baseline emissions) and the total volume of Eligible BA that was used during the project (project emissions) over the same corresponding time period.

1.4 CREDITING PERIODS

The crediting period shall be ten years. The Methodology’s quantification approach is based upon the UNFCCC small system method which includes the manufacturing and use of the foam product. The Methodology excludes any calculation of EOL emissions. EOL emissions may be considered in future versions of this Methodology.

1.5 PERIODIC REVIEWS AND REVISIONS

ACR may require revisions to this Methodology to ensure that monitoring, reporting, and verification systems adequately reflect changes to project activities. This Methodology may also be periodically updated to reflect regulatory changes, emission factor revisions, or expanded applicability criteria. Before beginning a project, the project proponent should ensure that they are using the latest version of the Methodology.
2 PROJECT BOUNDARIES

The project boundary delineates the sources, sinks, and reservoirs (SSRs) that must be included or excluded when quantifying the net changes in emissions associated with the transition to an Eligible BA. Figure 1 illustrates the GHG assessment boundary for a project.

Figure 1: Illustration of the Project Boundary

All SSRs in green are included and must be accounted for under this Methodology. SSRs in gray are not included under this Methodology.

3 BASELINE DETERMINATION AND ADDITIONALITY

3.1 BASELINE DETERMINATION

The baseline for a project is calculated using: (1) the GWP of the Baseline BA, (2) data associated with the quantity of Eligible BA used in the project, and (3) the emission factor associated with the Eligible Foam Application.

As a reference, Table 3 lists some of the most common BAs currently used in North America.

Table 3: GWP of Common Baseline BAs

<table>
<thead>

</tr>
<tr>
<td>HFC-245fa</td>
<td>1030</td>
</tr>
<tr>
<td>HFC-134a</td>
<td>1430</td>
</tr>
</tbody>
</table>

3.2 ADDITIONALITY ASSESSMENT

Emission reductions from the project must be additional, or deemed not to occur in the “business-as-usual” scenario. Assessment of the additionality of a project will be made based on passing the two tests cited below. These two tests require the project proponent to demonstrate that the project is surplus to regulations and reduces emissions below the level established in the Methodology.

- Regulatory Surplus Test
- Practice-Based Performance Standard

---

2 This data is used to calculate the amount of Baseline BA that would have been used to produce a foam of equivalent thermal performance that is produced with the Eligible BA.

3 This is not an exhaustive list but rather a guidance table for project proponents.

4 IPCC, Fourth Assessment Report (100-year GWP time horizon).
3.2.1 Regulatory Surplus Test

In order to pass the regulatory surplus test a project must not be mandated by existing laws, regulations, statutes, legal rulings, or other regulatory frameworks in effect as of the start date. The project proponent must demonstrate that there is no existing regulation that mandates the project or effectively requires the GHG emission reductions associated with the transition to an Eligible BA.\(^5\)

3.2.2 Practice-Based Performance Standard

For a project to qualify for offsets under this Methodology it must also be demonstrated that the Eligible Foam Application has a low market adoption rate for Eligible BAs. This Methodology has already completed a market adoption analysis, and hence an additionality demonstration for the foam applications stated in Table 1. Project proponents must only show that their project falls into one of the Eligible Foam Applications found in Table 1.

Market research showing these applications to have low market adoption rates included, but was not limited, to the following: 1) review of the EPA SNAP rule, 2) various CARB and industry research reports, 3) a market characterization study commissioned for the Methodology, and 4) conversations with various regulatory bodies and industry experts. Additional applications may be added through revisions to this Methodology. A discussion of the development of the performance standard is found in Appendix A.

---

\(^5\) Project proponents should address the potential applicability of SNAP 20 and SNAP 21 regulations adopted by EPA in July 2015 and December 2016 in light of the decision by the Court of Appeals for the District of Columbia. in No. 15-1328; Executive Order 13783 (March 28, 2017, 82 FR 16093-97); and any following regulatory action by EPA.
4 QUANTIFICATION OF GHG EMISSION REDUCTIONS

Quantification of emission reductions requires the calculation of baseline emissions and project emissions using production data, the GWPs of the Baseline and Eligible BA, and the emission factor associated with the Eligible Foam Application.

The GHG emissions from the BA used in foam production occurs at three phases of the product lifecycle, (i.e. manufacturing, use, and EOL). Only manufacturing and foam use for the first 10 years are considered in this Methodology.

<td>15</td>
<td>12.5</td>
<td>0.5</td>
</tr>
</tbody>
</table>

6 All offsets for a project’s manufacturing and use over the 10-year crediting period will be issued following verification. For example, an XPS foam production line using 100% HFC-134a (Baseline BA) with a GWP of 1430 converts to 100% of an Eligible BA with a GWP of 1 on January 1, 2017. The reporting period is January 1, 2017 through December 31, 2017. All foam produced on the foam line within that timeframe has the potential to create offsets under this Methodology, provided the required monitoring and recordkeeping is maintained. Assuming the quantity of Eligible BA used during that timeframe was 250,000 pounds and the BA ratio is 2, the emission reductions associated with the manufacturing and 10-year use of foam produced during the reporting period would be 102,935 MT CO₂e or 102,935 offsets issued, following verification.

4.1 BASELINE EMISSIONS

4.1.1 Baseline emissions associated with foam manufacturing and first year of foam use

These emissions are calculated as the total quantity of Baseline BA that would have been used for the foam manufacturing in absence of the Project Activity, multiplied by the first-year loss emission factor associated with the foam application (Tables 4 and 5), multiplied by the GWP of the Baseline BA. For foam applications required to transition to a different BA as the result of a regulation, the GWP of a Default BA may be used if it can be demonstrated that the Default BA is the alternative most likely to be used upon transition. Project proponents shall provide documentation, which shall include financial, market and/or technical analyses, to justify the use of the Default BA. This documentation shall be subject to review by the ACR and assessment by the chosen verification body.

9 Source: Table 7.6 and Table 7.7, Page 7.37, Chapter 7: Emissions of fluorinated substitutes for Ozone depleting substances, Volume 3, Industrial Processes and Product Use, 2006 IPCC Guidelines for National Greenhouse Gas Inventories.

10 Includes emissions associated with foam manufacturing.
4.1.2 Baseline emissions associated with the remaining years of foam use

These emissions are calculated as the total quantity of Baseline BA that would have been used in the foam manufacturing in the absence of the Project Activity, multiplied by the annual loss emission factor associated with the foam application (Tables 4 and 5) multiplied by the number of years remaining in the project\textsuperscript{11}, multiplied by the GWP of the Baseline BA.

4.1.3 Calculating Baseline BA Blends

When the BA is a blend, baseline emissions are only calculated for the constituent BA that is being transitioned to the Eligible BA. In the event that each constituent of the Baseline BA is transitioned, each constituent of the Baseline BA is calculated separately.

\textbf{Equation 1}

\[ \text{BE}_{\text{BBA}} = \left\{ \left[ \left( Q_{\text{BBA}} \times \text{FYL}_{\text{BBA}} \right) + \left( Q_{\text{BBA}} \times \text{AL}_{\text{BBA}} \times \text{YR} \right) \right] \div 2204.62 \right\} \times \text{GWP}_{\text{BBA}} \]

\textbf{WHERE}

\begin{tabular}{|l|l|}
\hline
\textbf{BE}_{\text{BBA}} & Baseline emissions (MT CO\textsubscript{2}e) \\
\hline
\textbf{Q}_{\text{BBA}} & The quantity of Baseline BA (in pounds) which would have been used to manufacture the foam in the absence of the project activity, using Equation 2 \\
\hline
\textbf{FYL}_{\text{BBA}} & The first-year loss emission factor associated with the foam application (See Tables 4 and 5) \\
\hline
\textbf{AL}_{\text{BBA}} & The annual loss emission factor associated with the foam application (See Tables 4 and 5) \\
\hline
\textbf{YR} & The number of years remaining in the project (equal to 9 years) \\
\hline
\textbf{2204.62} & Pound to metric ton conversion \\
\hline
\textbf{GWP}_{\text{BBA}} & The GWP of the Baseline BA\textsuperscript{12} \\
\hline
\end{tabular}

\textsuperscript{11} Emission reductions are quantified over 10 years. The first-year emissions are accounted for in the first year loss emission factor, therefore, a maximum of 9 years remain to be calculated for usage emissions.

\textsuperscript{12} For projects required to transition as a result of a regulation, the GWP of the Default BA will be used.
To calculate the quantity of Baseline BA that would have been used in the absence of the project activity, Equation 2 is applied.

**Equation 2**

\[
Q_{BBA} = Q_{EBA} \times \text{BAR}
\]

**WHERE**

- **\(Q_{BBA}\)**: The quantity of Baseline BA (in pounds) which would have been used to manufacture the foam in the absence of the project activity.
- **\(Q_{EBA}\)**: The quantity of Eligible BA (in pounds) which is used to manufacture the foam for the project.
- **\(\text{BAR}\)**: Blowing Agent Ratio - The quantity of Eligible BA, as compared to the Baseline BA, that is required to replace the Baseline BA to produce a foam with equivalent thermal performance (%).

### 4.2 PROJECT EMISSIONS

#### 4.2.1 Project emissions associated with foam manufacturing and first year of foam use

These emissions are calculated as the total quantity of Eligible BA that is used in the project, multiplied by the first-year loss emission factor associated with the foam application (same as the emission factor used in Equation 1), multiplied by the GWP of the Eligible BA.

#### 4.2.2 Project emissions associated with the remaining years of foam use

These emissions are calculated using the total quantity of Eligible BA used in the project, multiplied by the annual loss emission factor associated with the foam application (same as the emission factor used in Equation 1), multiplied by the number of years remaining in the project, multiplied by the GWP of the Eligible BA.
4.2.3 Calculating Project BA Blends

When the BA is a blend, project emissions are only calculated for the Eligible BA portion of the blend.

**Equation 3**

\[
PE_{BA} = \left\{ \left[ (Q_{BA} \times FYL_{BA}) + (Q_{BA} \times AL_{BA} \times YR) \right] \div 2204.62 \right\} \times GWP_{BA}
\]

**WHERE**

- \(PE_{BA}\): Project emissions (MT CO\textsubscript{2}e)
- \(Q_{BA}\): The quantity of Eligible BA (in pounds), which is used to manufacture the foam for the project
- \(FYL_{BA}\): The first-year loss rate emission factor of the foam application (set equal to emission factor used in Equation 1)
- \(AL_{BA}\): The annual loss rate emission factor of the foam application (set equal to emission factor used in Equation 1)
- \(YR\): The number of years remaining in the Project Activity (9 years)
- 2204.62: Pound to metric ton conversion
- \(GWP_{BA}\): The GWP of the Eligible BA

4.3 LEAKAGE

4.3.1 Market-shifting leakage emissions

Transition to an Eligible BA does not cause the displaced BA to be used elsewhere. There is no market-shifting leakage and hence is to be disregarded.

4.3.2 Activity-shifting leakage emissions

If the Project Activity results in the equipment used in the baseline being transferred to another location or activity in which a BA with a GWP greater than 30 is used, leakage effects are to be
Considered. If the baseline equipment is also used in the project or is decommissioned, then leakage is to be disregarded.

- **Activity shifting leakage emissions associated with the foam manufacturing and first year of foam use**: These emissions are calculated as the total quantity of BA with a GWP greater than 30 that is being used at the new location with the baseline equipment, multiplied by the first year loss emission factor associated with the foam application (Tables 5 and 6), multiplied by the GWP of the BA.

- **Activity shifting leakage emissions associated with the remaining years of foam use**: These emissions are calculated as the total quantity of BA with a GWP greater than 30 that is being used at the new location with the baseline equipment, multiplied by the annual loss emission factor associated with the foam application (Tables 4 and 5), multiplied by the number of years remaining in the project, multiplied by the GWP of the BA.

**Equation 4**

\[
LE_{LBA} = \left\{ \left[ (Q_{LBA} \times FYL_{LBA}) + (Q_{LBA} \times AL_{LBA} \times YR) \right] \div 2204.62 \right\} \times GWP_{LBA}
\]

**WHERE**

- **LE_{LBA}**: Activity shifting leakage emissions (MT CO₂e)
- **Q_{LBA}**: The quantity of BA (in pounds) that is used at the new location
- **FYL_{LBA}**: The first-year loss emission factor associated with the foam application of the BA used at the new location (See Tables 4 and 5)
- **AL_{LBA}**: The annual loss emission factor associated with the foam application of the BA used at the new location (See Tables 4 and 5)
- **YR**: The number of remaining years in the project (9 years)
- **2204.62**: Pound to metric ton conversion
- **GWP_{LBA}**: The GWP of the BA used at the new location

### 4.4 EMISSION REDUCTIONS

The emission reductions achieved as a result of the transition to an Eligible BA are calculated as the baseline emissions minus the leakage emissions (if applicable) minus the project emissions. Annual losses beyond year ten and EOL emissions shall not be calculated.
Equation 5\textsuperscript{13}

\[ \text{ER} = ((\text{BE}_{\text{BBA}} - \text{LE}_{\text{LBA}}) - \text{PE}_{\text{EBA}}) \times (1 - \text{DF}) \]

\textbf{WHERE}

<table>
<thead>
<tr>
<th>ER</th>
<th>Emission reductions (MT CO\textsubscript{2}e)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BE\textsubscript{BBA}</td>
<td>Equation 1 - Baseline emissions (MT CO\textsubscript{2}e)</td>

</tr>
<tr>
<td>DF</td>
<td>0.03 – Discount Factor (if applicable)\textsuperscript{14}</td>
</tr>
</tbody>
</table>

\textsuperscript{13} As stated in Sections 4.1 and 4.2, where a BA blend is used, emissions are to be quantified separately for each constituent BA. As a result, a summation of baseline, project, and leakage emissions for the project shall occur to accurately quantify total emission reductions associated with a project.

\textsuperscript{14} See Footnote 15 for applicability
5 MONITORING AND DATA COLLECTION

Each project shall include a monitoring, reporting and verification plan sufficient to meet the requirements of the ACR Standard. The plan shall describe the collection of all data to be monitored and in a manner which meets the requirements for accuracy and precision of this Methodology.

This Methodology is based on determining the amount of BA that was or would have been used prior to project implementation and the amount of an Eligible BA used during the project. Project proponents are expected to provide data based on production quantity inputs to the manufacturing process (as shown in Figure 1). The Monitoring Plan shall provide inputs for all applicable equations used in this Methodology.

The project proponent is responsible for the collection and maintenance of all required data and monitoring parameters.

Individual manufacturing facilities or construction sites may be aggregated into a single project provided each of the facilities/sites meet the Applicability Conditions (1.2) and the project proponent provides the monitoring and recordkeeping as required by this Methodology.

5.1 DESCRIPTION OF THE MONITORING PLAN

The project proponent must prepare a monitoring plan describing the following:

- The location and recordkeeping/retention for all stored data.
- The methods used to generate data.
- Transfer points and methods of non-automated transfer of data.
- If applicable, describe any calibration procedures and the frequency with which calibration and other maintenance requirements are performed.
- Describe the internal audit and other quality assurance/quality control procedures.
- Sampling methods utilized and performed during the reporting period, if applicable.

The rationale for monitoring project implementation is to document all project activities implemented by the project proponent.
5.2 DATA COLLECTION AND PARAMETERS TO BE MONITORED

5.2.1 Monitoring requirements for all project types

For all projects, the process for monitoring the project’s emission reduction parameters includes:

- Records documenting the foam application used in the baseline and project.
- For all foam applications, other than projects which will use the Default BA, records documenting the Baseline BA used in the project showing a minimum of 2 years of usage prior to the Project Activity.
- Records documenting the amount of the Eligible BA consumed in the Project Activity. Acceptable documentation may include any of the following, but is not limited to:
  - Weight records (in pounds) of Eligible BA material used;
  - Flow meter records of Eligible BA material used;
  - Number of products produced using the Eligible BA and the quantity (in pounds) of material in each unit manufactured;
- Records documenting the calibration of any weigh scales, flow meters, or similar measurement devices used to document the amount of Eligible BA consumed in the Project Activity.
  - Calibration must be conducted on intervals recommended by the manufacturer and documentation of calibration events shall be recorded and maintained.
- Records used in support of the BA ratio for the project including all calculations to derive the BA ratio.
- Equipment log for all equipment used in the project.

---

15 For spray foam projects that only provide documentation on the amount of Eligible BA delivered (to a construction site, for example) and/or purchased for a project, a discount factor of 3.0% shall be applied in the quantification of emission reductions (see equation 5).
16 For project types other than spray foam that supply pre-shipment weight information for the Eligible BA delivered via tanks, drums, totes, or containers, the return weight of the tanks, drums, totes, or containers shall also be provided to ensure that any “heel” remaining has been accurately deducted. Alternatively, a project (project types other than spray foam) supplying pre-shipment weight information that does not also supply the return weight may validate the pre-shipment weight of Eligible BA by providing additional evidence to the verifier to corroborate the amount of Eligible BA consumed in the project. Non-spray foam project types supplying pre-shipment weight information for the Eligible BA are not eligible to apply a discount factor in the quantification of emission reductions in lieu of sufficient evidence to confirm the amount of Eligible BA consumed in the project.
Identification and log of any equipment modified, replaced, or decommissioned as a result of the Project Activity and any equipment moved for use outside of the project boundaries (leakage).

For project proponents applying a Default BA: financial, market and/or technical analyses to justify the use of the Default BA.

5.2.2 Additional monitoring requirements for Formulators and/or Systems Supply Houses

For projects where a Formulator or a Systems Supply House is the Project Proponent (e.g. provides the A side and B side materials as a foam system in tanks, totes, drums or other containers) the following requirements must also be met in addition to those requirements in Section 5.2.1:

- Records documenting that the foam system supplied to the foam manufacturer by the Formulator/Systems Supply House was shipped to and received by the foam manufacturer. Acceptable documentation may include, but is not limited to:
  - Bills of lading or other business records provided by the transport company as receipt of shipped material.
- Records documenting that the foam system supplied to the foam manufacturer by the Formulator/Systems Supply House was used in the application identified by the Project. Acceptable documentation may include any of the following:
  - Documentation from the Formulator/Systems Supply House;
  - Documentation from the foam manufacturer;
  - Signed attestation from the foam manufacturer.

5.2.3 Additional monitoring requirements for spray foam projects

For projects where a Formulator/Systems Supply House that is supplying spray foam is the Project Proponent (e.g. the A-side and B-side materials are supplied in tanks, totes, drums or other containers for use in Spray Foam applications) the following requirements must also be met in addition to those requirements in Section 5.2.1:

- Attestations must be obtained from distributors and contractors representing a minimum of 10 percent of the volume of Eligible BA included in the Project Activity.

---

17 For all applications except spray foam.
18 Attestations must be collected from a minimum of one distributor and two foam insulation contractors, per project.
Attestations must document the following:
- Approximate date(s) of foam production;
- Confirmation that all A side and B side materials sent to the construction site were consumed on the date(s) specified.
- For consecutive annual or sub-annual projects, attestations may only be provided from the same distributors and contractors once every third project validation/verification.

APPENDIX A: DEVELOPMENT OF PERFORMANCE STANDARD

In developing the Methodology, information about BA use in the foam industry was gathered and reviewed. This included several studies, reports, and conversations with industry experts, regulatory personnel, and foam manufacturers. Additionally, a market research report was commissioned on the "Global Foam Blowing Agents Market Size, Share, Development, Growth, and Demand Forecast". The ACR peer review process was also relied upon to identify the market penetration of all BAs and then to identify the Eligible Foam Applications, which are shown in Methodology Table 1 and repeated below.

Table 6: Eligible Foam Applications

<table>
<thead>
<tr>
<th>FOAM APPLICATION</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>XPS boardstock</td>
<td>Boardstock, block, and billet that is used for insulation in the following applications: roofing, walls, flooring, and pipes. Does not include XPS sheet foam applications.</td>
</tr>
<tr>
<td>Two-component rigid PU spray foam</td>
<td>Spray foam is a two-part polyurethane application that when combined forms a solid foam insulation; involves a gun, nozzle or straw and forms foam as the ingredient chemicals are blended together.</td>
</tr>
</tbody>
</table>
| Rigid PU injected foam | A manufacturing process for producing component parts by injecting two or more liquid streams into a mold or part. Materials for the component are fed into a mix-head, mixed, and forced into the mold cavity, where they react, foam, cool and harden to the configuration of the cavity. Only Rigid PU injected foam used in the following sub-applications are eligible:  
  - Marine flotation or buoyancy  
  - Heating, Ventilation, Air Conditioning and Air Handling Systems  
  - Refrigerated Transport – Foam used in refrigerated logistics services such as refrigerated cargo boxes and coolers |
To construct the performance standard, it was important to determine which sectors had high penetration rates for low GWP BA. Based on market research, it was determined that the following sectors already had high penetration rates for certain low GWP BA (primarily HC BA which are commonly considered to be lower GWP BA):

- PU Spray, other than two-component PU Spray
- Rigid PUF discontinuous panel
- Rigid PUF continuous laminate/boardstock
- Rigid PUF block for pipe sections
- Rigid PUF discontinuous block for panels
- Rigid PUF pipe-in-pipe
- Rigid PUF discontinuous block for pipe sections
- Rigid PUF continuous block
- XPS sheet

The primary outcome that the Methodology is meant to incentivize (reduced GHG emissions from foam BA consumption) is already being achieved in the above applications at rates that are higher than acceptable for crediting under this Methodology. Further, it was also clear that the use of HC BA should be considered business as usual for foam production. There are many additional concerns with HC BA such as high flammability risks, cost associated with flame proofing and safety measures, status as volatile organic compounds, and the generally lower thermal efficiency of foams produced by HC BA as compared to many alternatives. For these reasons, the Methodology credits only advanced formulation BAs and HC are ineligible for crediting.
Table 7 shows the market penetration rates of Eligible BAs. Table 8 shows the market penetration rates of Eligible BAs with the addition of the percentage of HC BAs consumed in these applications. As is shown, the eligible foam applications have extremely low adoption rates for Eligible BA and are also not achieving high rates of low GWP BA adoption, in general.

</tr>
</tbody>
</table>

\textsuperscript{20} Per U.S. EPA, methyl formate’s GWP is expected to be low, based on similarity to other compounds with GWPs that have been published in the peer-reviewed literature (see IPCC 4th Assessment Report, Table 2.15). Per the Federal Register, the GWP is stated to be “very low or zero” in all Federal Register listings (for methyl formate and Ecomate). For purposes of this Methodology, the GWP shall be set equal to 5 in Project emission reduction calculations.

\textsuperscript{21} AR5

\textsuperscript{22} AR4

\textsuperscript{23} Per the Federal Register, the GWP is reported as less than 3. For purposes of this Methodology, the GWP shall be set equal to 3 in Project emission reduction calculations.

\textsuperscript{24} Per AR5, the GWP is less than 1. For purposes of this Methodology, the GWP shall be set equal to 1 in Project emission reduction calculations.
